

Third brake light fitting on an MX5 ND

This is likely to be a similar process on other models and applies to boot-bag & luggage racks

The third brake light on a MX5 ND attaches to a plug at the top back left of the boot. The carpet on the left will need to be pulled away to reveal it

Disconnect the plug. You can see the cable running at the back of the boot up the light at the rear of the boot lid.

We suggest you carefully cut the wire and using a terminal block make a spur joining the original cable back together with two additional wires in one side of the terminal block.

This can be either another terminal block or another Hopkins connector

Connect the spur via the terminal block then wrap the joint in insulation tape.

Reconnect the wiring to the socket on the left and you are left with a connector that at any time you connect the third brake light too.

In this case the Hopkins 47965 connector but it could also be just a terminal block

Mazda Kit - you buy the Mazda loom for the light if you don't want to cut the wire and use the connector we are told its about 35€/£30/\$33
